

Our patent pending CryoSonic™ Extraction Process uses pure ethanol, the exact same 200 proof alcohol that is sold in liquor stores, and sub-zero temperatures combined with Ultrasonic sound waves to extract all the compounds found in the plant.... exactly as they exist naturally in the plant. All 120+ known cannabinoids, flavonoids, amino acids, proteins, terpenes, etc. are extracted and maintained in their original form for maximum therapeutic effect.

Because focused ultrasound extraction in a Cryogenic atmosphere optimizes the radiated energy, it is ideally suited for the extraction of beneficial cannabinoids. This enhanced extraction is managed by exposing more surface area by reducing the particle size of the material being processed, thus disrupting the cell walls to release the desired compounds.

When extracted Cryosonically, the resulting concentrated nano emulsion is reminiscent of the cannabis strain it was extracted from – however, the taste, smell and effects are amplified due to a larger concentration by weight.
